Patent No. 6720311
GENERAL INFORMATION:
FAPLICANT: Tsai, David,
TITLE OF INVENTION: Polypeptide for the Treatment of Cancer and a Method of Preparati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TYPE: PRT
ORGANISM: Pig
LOCATION: 300..309
CTHER INFORMATION: Polypeptide fragment from fetuin.

Patent NO. 6610836
GENERAL INFORMATION:
APPLICANT: Gary Breton et. al
APPLICANT: Gary Breton et. al
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.2004001
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 1999-01-27
PRIOR APPLICATION NUMBER: US 60/117,747
PRIOR PILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
LENGTH: 463
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Process for inducing apoptosis in cancer cells involves use of alpha-2-human serum glycoprotein or its peptide fragment.

Disclosure; Page 11; 27pp; English.

The invention discloses a method for the induction of apoptosis in cancer cells which involves the administration of alpha-2-Human serum (HS) glycoprocein or its peptide fragment to the cancer cells. Alpha-2-HS glycoprotein is a homologue of bovine fetuin, which is a mainly foetal protein and has been shown to control tissue remodelling and physiological cell death during embryonic development, suggesting that it may contain an activity for inducing apoptosis. Methods are also disclosed for the preparation of supercharged zinc alpha 2-HS glycoprotein from alpha 2-HS glycoprotein, which exhibited an increased apoptotic activity. The method is used for inducing apoptosis in cancer cells and treating the cancer. The alpha-2-HS, which has been overloaded with zinc, as well as its fragments, exhibits selectivity for inducing apoptosis in HF-29 (colon cancer), INCaP (prostate cancer) and Hep G2 (Hepatoma) cells, and does not affect CEDIS CO (normal colon) cells. The sequence presented is the pig fetuin apoptosis-inducing peptide fragment

New compound comprising peptide fragment derived from specially prepared zinc-charged bovine fetuin, useful for treating colon and prostrate cancer, by causing apoptosis in colon cancer and prostate cancer cells.

Example; Page 11; 20pp; English

The invention relates to a compound for treatment of colon and prostate cancer produced from a peptide fragment derived from specially prepared cancer produced from a peptide fragment corresponds to annotate and corresponds to amino acid residues 300-309 of feruin (referred to as fecuin peptide fragment (FPF 300-309)), and human or mouse peptides that correspond to FPF 300-309. The human FPF causes apoptosis in colon cancer cells and prostate cancer cells. The invention also relates to preparing a polypeptide having apoptotic activity isolated from fetuin comprising incubating fetuin in solution with a chelating agent, isolating naked cetuin, incubating the naked fetuin in solution, driving the zinc charged fetuin a solution and classolving the dried zinc charged fetuin in water to form a solution and isolating from the solution, driving the zinc charged fetuin a solution and isolating from the solution the filtrates that have been predetermined to have apoptotic activity in cancer cells. The compound is useful for treating prostate or colon cancer by inducing apoptosis of the cancerous cells. This sequence represents a pig fetuin fragment of the invention.

The invention relates to a novel compound or fetuin polypeptides for the treatment of colon and prostate cancer, where the polypeptide causes apoptosis in colon and prostate cancer cells. A compound or peptide of the invention has cytostatic activity, and may have a use in protein therapy. The fetuin polypeptides are useful for treating colon and prostate cancer, thus offering a breakthrough in cancer therapy. The present sequence represents the porcine fetuin peptide fragment (FPF) 300-99, amino acids 300-309 of the full-length fetuin polypeptide. 100.0%; Score 49; DB 9; Length 10; 100.0%; Pred. No. 0.0025; tive 0; Mismatches 0; Indels Claim 11; SEQ ID NO 4; 20pp; English.

Cells which involves the administration of alpha-2-Human serum (HS)

'Glycoprotein or its peptide fragment to the cancer cells. Alpha-2-HS

Glycoprotein is a homologue of bovine fetuin, which is a mainly foetal

protein and has been shown to control tissue remodelling and

protein and has been shown to control tissue remodelling and

protein and has been shown to control tissue remodelling and

may contain an activity for inducing apoptosis. Methods are also

disclosed for the preparation of supercharged zinc alpha 2-HS

glycoprotein from alpha 2-HS glycoprotein, which exhibited an increased

apoptotic activity. The method is used for inducing apoptosis in cancer

cells and treating the cancer. The alpha-2-HS, which has been overloaded

with zinc, as well as its fragments, exhibits selectivity for inducing

apoptosis in HT-29 (colon cancer). LNCSP (prostate cancer) and Hep G2

(Hepatoma) cells, and does not affect CED18 CO (normal colon) cells. The

sequence presented is the rat fetuin apoptosis-inducing peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                              The invention discloses a method for the induction of apoptosis in cancer

cells which involves the administration of alpha-2-Human serum (HS)

cells which involves the administration of alpha-2-Human serum (HS)

cells which involves the administration of alpha-2-Human serum (HS)

cells which involves the administration of alpha-2-Human serum (HS)

cells an admologue of bovine fecuin, which is a mainly foetal protein and has been shown to control tissue remodelling and and to physiological cell death during embryonic development, suggesting that it of may contain an activity for inducing apoptosis. Methods are also cells contain an activity for inducing apoptosis methods are also control from alpha 2-HS glycoprotein, which exhibited an increased apoptotic activity. The method is used for inducing apoptosis in cancer cells and treating the cancer. The alpha-2-HS, which has been overloaded with zinc, as well as its fragments, exhibits selectivity for inducing apoptosis in HT-29 (colon cancer), INCaP (prostate cancer) and Hep G2 (Hepatoma) cells, and does not affect CEDIS CO (normal.colon) cells. The cangment #1

cells and does not affect CEDIS CO (normal.colon) cells. The cangment #1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                        The invention discloses a method for the induction of apoptosis in cancer cells which involves the administration of alpha-2-Human serum (HS) of alycoprotein or its peptide fragment to the cancer cells. Alpha-2-HS suproprotein is a homologue of bovine fetuin, which is a mainly foetal protein and has been shown to control tissue remodelling and physiological cell death during embryonic development, suggesting that it may contain an activity for inducing apoptosis. Methods are also disclosed for the preparation of supercharged zinc alpha 2-HS copprotein from alpha 2-HS alycoprotein, which exhibited an increased apoptotic activity. The method is used for inducing apoptosis in cancer cells and treating the cancer. The alpha-2-HS, which has been overloaded with zinc, as well as its fragments, exhibits selectivity for inducing apoptosis in HT-29 (colon cancer). INCaP (prostate cancer) and Hep G2 (Hepatoma) cells, and does not affect CED18 CO (normal colon) cells. The sequence presented is the sheep fetuin apoptosis-inducing peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bovine; cow; apoptosis; fetuin; cancer; alpha-2-Human serum glycoprotein; alpha-2-HS glycoprotein; foetal protein; tissue remodelling; cell death; embryonic development; supercharged zinc alpha 2-HS glycoprotein; HT-29; colon cancer; LNCaP; prostate cancer; Hep G2; Hepatoma; cytostatic;
                                                                                                                                                                                                                            Process for inducing apoptosis in cancer cells involves use of alpha-2-human serum glycoprotein or its peptide fragment.

New compound comprising peptide fragment derived from specially prepared zinc-charged bovine fetuin, useful for treating colon and prostrate cancer, by causing apoptosis in colon cancer and prostate cancer cells.

Example; Page 11; 20pp; English

The invention relates to a compound for treatment of colon and prostate cancer produced from a peptide fragment derived from specially prepared zinc-charged bovine fetulin, where the peptide fragment corresponds to amino acid residues 300-309 of fetuin (referred to as fetuin peptide fragment (FPF 300-309), and human or mouse peptides that correspond to fragment (FPF 300-309). The human FPF causes apoptosis in colon cancer cells and prostate cancer cells. The invention also relates to preparing a poptotic activity isolated from fetuin comprising color peptide having apoptotic activity isolated from fetuin comprising color cancer cells and color peptide having apoptotic activity isolated from fetuin comprising fetuin in solution with a chelating agent, isolating naked fetuin in color charged fetuin in water to form a solution and isolating from the solution, driving the zinc charged fetuin in water to form a solution and isolating from the solution the filtrates that have been predetermined to have apoptotic activity in cancer cells. The compound is useful for treating prostate or colon cancer by inducing apoptosis of the invention. ö Sheep, colon cancer, prostate cancer, zinc-charged bovine fetuin, fetuin, fetuin, peptide fragment, FPF, apoptosis. prostate cancer cells. The invention also relates to preparing a polygeptide having apoptotic activity isolated from fetuin comprising incubating apotectic activity isolated from fetuin comprising fetuin, incubating the naked fetuin in solution with zinc, isolating naked fetuin, incubating the solution, drying the zinc charged fetuin, from the solution, drying the zinc charged fetuin, drying the zinc charged fetuin in water to form a solution and isolating from the solution the filtrates that have been predetermined to thave apoptotic activity in cancer cells. The compound is useful for treating prostate or colon cancer by inducing apoptosis of the cancerous cells. This sequence represents a sheep fetuin fragment of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel compound or fetuin polypeptides for the treatment of colon and prostate cancer, where the polypeptide causes apoptosis in colon and prostate cancer. A compound or peptide of the invention has cytostatic activity, and may have a use in protein therapy. The fetuin polypeptides are useful for treating colon and prostate cancer, thus offering a breakthrough in cancer therapy. The present sequence represents the bovine feuuin peptide fragment (FPF) 300-09, amino acids 300-309 of the full-length fetuin polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compound or fetuin polypeptides useful for treating colon and prostate cancer by causing apoptosis in colon and prostate cancer cells, thus offering a breakthrough in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                 fetuin; colon tumor; prostate tumor; neoplasm; apoptosis; cytostatic; protein therapy.
                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel compound or fetuin polypeptides for the treatment of colon and prostate cancer, where the polypeptide causes apoptosis in colon and prostate cells. A compound or peptide of the invention has cytostatic activity, and may have a use in protein therapy. The fetuin polypeptides are useful for treating colon and prostate cancer, thus offering a breakthrough in cancer therapy. The present sequence represents the rat fetuin peptide fragment (FPP) 300-09, amino acids 300-309 of the full-length fetuin polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compound or fetuin polypeptides useful for treating colon and prostate cancer by causing apoptosis in colon and prostate cancer cells, thus offering a breakthrough in cancer therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                     The invention relates to a novel compound or fetuin polypeptides for the treatment of colon and prostate cancer, where the polypeptide causes apoptosis in colon and prostate cancer cells. A compound or peptide of the invention has cytostatic activity, and may have a use in protein therapy. The fetuin polypeptides are useful for treating colon and prostate cancer, thus offering a breakthrough in cancer therapy. The present sequence represents the ovine fetuin peptide fragment (FPF) 300-09, amino acids 300-309 of the full-length fetuin polypeptide.
                                                                                                                                                                                                                                                               New compound or fetuin polypeptides useful for treating colon and prostate cancer by causing apoptosis in colon and prostate cancer cells, thus offering a breakthrough in cancer therapy.

The invention relates to a novel method of mass spectrometry. The method comprises mass analysing the first molecules in a first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture. The invention further relates to: generating an index constraint in the mass to charge ratios of molecules on index constraints and index to spectrometry by accurately determining the masses or mass to charge carbook first molecules comprising peptide or protein; determining a first physicocomplex in property other than mass or mass to charge ratio of the molecules comprising peptides; and optionally determining a second, third, fourth and/or fifth physico-chemical property of the molecules comprising peptides; and optionally determining a second, third, fourth and/or fifth physico-chemical property of the first molecules or comprising the mass to charge ratio of the first molecules of the basis of the second, third, fourth and/or fifth physico-chemical property and the accurately determined mass to charge ratio of the first molecules and optionally on the basis of the first molecules and optionally on the property. The method and spectrometer are useful in protein cleanification, protein quantitation, proteases, high-resolution mass spectrometry, more mass created by the form an indexed peptide database created by the revenue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                        A method of mass spectrometry, useful in protein identification and quantitation, by mass analyzing the first molecules in the first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, alpha-2HS-glycoprotein, alpha-2HS; fetuin, alpha-2Z-globulin,
plasma glycoprotein, antiinflammatory; tissue damage; ischemia; stroke,

This sequence represents a human fetuin polypeptide, a foetal plasma glycoprotein, which is used to help prevent miscarriages during preparery, and for treating pre-term labour during pregnancy. Fetuin acts by suppressing tumour necrosis factor (TNP) secretion by spermine. TNF is secreted by mononuclear cells, and increased levels result in spontaneous
and a therapeutic aromatic or heterocyclic guanyl hydrazone, which is positively charged at physiological pH. The complex has anti-inflammatory activity, based on suppression of pro-inflammatory cytokine synthesis in activated macrophages and other cells (e.g. suppression of TNF-alpha synthesis in LPS-activated macrophages). The presence of fetuin as a drug complex or in combination with the therapeutically active small molecule compound enhances therapeutic activity of the small molecule compound. The present invention further provides a means for screening for therapeutically active small molecule compounds. The present sequence represents human fetuin glycoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                    The present sequence represents a fragment of the bovine alpha-2HS-glycoprotein (alpha-2HS) (HS not defined). The polypeptide is also known as fetuin, alpha-2Z-globulin. The polypeptide is a plasma glycoprotein. Alpha-2HS is a major protein occurring in human blood and calciferous tissues. The polypeptide is an antinflammatory activity potentiator. It is used for treating or inhibiting tissue damage caused by ischemia which is manifest as stroke or as myocardial infarction. Administration of alpha-2HS was found to suppress production of tumour necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Complex or combination of guanyl-hydrazone compound - with glycosylated polypeptide, especially fetuin, providing enhanced anti-inflammatory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel complex which comprises a glycosylated peptide selected from mammalian fetuin and/or alpha 2-HS glycoprotein,
                                                                                                                                            Novel methods for treating tissue ischemia or inhibiting tissue damage associated with ischemia, of the brain and heart in a subject involves

The invention relates to methods and constructs for protein expression, in particular, the expression of Glial Growth Factor 2 (GGF2). The method comprises transforming a mammalian host cell with an expression vector containing an expressible mammalian fetuin gene and transforming the same mammalian host cell with an expression vector containing an expressible gene which encodes the desired protein, culturing the transformed host cells and isolating the desired protein. The present sequence represents a bovine fetuin polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Method for isolating a desired protein from a mammalian host cell, using an expression vector containing a fetuin gene, useful for production of
                                                                                                                          Glial Growth Factor 2; GGF2; protein expression; fetuin; bovine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     93.9%; Score 46; DB 3; Length 359; 90.0%; Pred. The present sequence represents a bovine alpha2-Heremans Schmid
Glycoprotein (AHSG). The human Ahsg gene is located on chromosome 3q27.
AHSG inhibits insulin-induced autophosphorylation of the insulin receptor
and insulin receptor tyrosine kinase (H-TK) activity. Genetic ablation
of the Ahsg gene enhances insulin signal transduction and increases whole
co the Ahsg gene enhances insulin signal transduction and increases whole
co transity insulin sensitivity. The phosphorylation status of AHSG is critical
for IR-TK inhibition. The human AHSG protein exists in 2 variant forms.
Cariant AHSG*1 (ABB7014) has a Thr at position 248 and Thr at position
caposition 256. Variant AHSG*2 (ABB78015) has a Met at position 248 and Ser at
phosphorylation of tyrosine kinase activity in a cell augments
phosphorylation or tyrosine kinase activity of insulin receptors in
clave/muscle cell. AHSG modulators can therefore be used for treating
obesity and insulin resistance, increasing insulin sensitivity,
coperum and insulin insuling effect of high-fat diet on body weight gain, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting alpha 2-Heremans Schmid Glycoprotein activity, augmenting phosphorylation/tyrosine kinase activity of insulin receptors, or treating obesity and insulin resistance, by inhibiting AHSG activity in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse; apoptosis; fetuin; cancer; alpha-2-Human serum glycoprotein; alpha-2-HS glycoprotein; foetal protein; rissue remodelling; cell death; embryonic development; supercharged zinc alpha 2-HS glycoprotein; HT-29; colon cancer; LNCaP; prostate cancer; Hep G2; Hepatoma; cytostatic;

The invention relates to a compound for treatment of colon and prostate cancer produced from a peptide fragment derived from specially prepared zinc-charged bovine fetuin, where the peptide fragment corresponds to amino acid residues 300-309 of fetuin (referred to as fetuin peptide (fragment (FPF 300-309)), and human or mouse peptides that correspond to FPF 300-309. The human FPF causes apoptosis in colon cancer cells and prostate cancer calls. The invention also relates to preparing a correspond to prostate cancer calls. The invention also relates to preparing a colon propertied having apoptotic activity isolated from fetuin comprising cincubating fetuin in solution with a chelating agent, isolating naked celetuin, incubating the naked fetuin in solution with zinc, isolating ainc charged fetuin in solution with zinc, isolating and coloring the zinc charged fetuin in water to form a solution and isolating from the solution, driving the zinc charged fetuin concers that have been predetermined to have apoptotic activity in cancer cells. The compound is useful for treating prostate or colon cancer by inducing apoptosis of the invention.
                                                                                                                                                                                                                                New compound comprising peptide fragment derived from specially prepared zinc-charged bovine fetuin, useful for treating colon and prostrate cancer, by causing apoptosis in colon cancer and prostate cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     fetuin; colon tumor; prostate tumor; neoplasm; apoptosis; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention discloses a method for the induction of apoptosis in cancer cells which involves the administration of alpha-2-Human serum (HS) glycoprotein or its peptide fragment to the cancer cells. Alpha-2-HS clycoprotein is a homologue of bovine fetuin, which is a mainly foetal protein and has been shown to control tissue remodelling and planally footal physiological cell death during embryonic development, suggesting that it may contain an activity for inducing apoptosis. Methods are also disclosed for the preparation of supercharged zinc alpha 2-HS glycoprotein from alpha 2-HS glycoprotein, which exhibited an increased supprotic activity. The method is used for inducing apoptosis in cancer cells and treating the cancer. The alpha-2-HS, which has been overloaded with zinc, as well as its fragments, exhibits selectivity for inducing capoptosis in HT-29 (colon cancer), LNCAP (prostate cancer) and Hep G2 (Hepatoma) cells, and does not affect CEDIB CO (normal colon) cells. The sequence presented is the mouse fetuin apoptosis-inducing peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse, colon cancer, prostate cancer, zinc-charged bovine fetuin, fetuin, fetuin, fetuin,
                                                                                                                                                                                                                                                                                                                                                                      Process for inducing apoptosis in cancer cells involves use of alpha-2-human serum glycoprotein or its peptide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                         The invention relates to a novel compound or fetuin polypeptides for the treatment of colon and prostate cancer, where the polypeptide causes apoptosis in colon and prostate cancer cells. A compound or peptide of the invention has cytostatic activity, and may have a use in protein therapy. The fetuin polypeptides are useful for treating colon and prostate cancer, thus offering a breakthrough in cancer therapy. The present sequence represents the murine fetuin peptide fragment (FPF) 300-09, amino acids 300-309 of the full-length fetuin polypeptide.
                                                                                                          New compound or fetuin polypeptides useful for treating colon and prostate cancer by causing apoptosis in colon and prostate cancer cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting alpha 2-Heremans Schmid Glycoprotein activity, augmenting phosphorylation/tyrosine kinase activity of insulin receptors, or treating obesity and insulin resistance, by inhibiting AHSG activity in

AHSG inhibits insulin-induced autophosphorylation of the insulin receptor and insulin receptor tyrosine kinase (IR-TK) activity. Genetic ablation of the Ahsg gene enhances insulin signal transduction and increases whole body insulin sensitivity. The phosphorylation status of AHSG is critical for IR-TK inhibition. The human AHSG protein exists in 2 variant forms. Variant AHSG*1 (ABB7014) has a Thr at position 248 and Thr at position 256. Variant AHSG*2 (ABB7015) has a Met at position 248 and Ser at position 256. Inhibition of AHSG activity in a cell augments phosphorylation or tyrosine kinase activity of insulin receptors in liver/muscle cell. AHSG modulators can therefore be used for treating obesity and insulin resistance, increasing insulin sensitivity, or lowering total body fat content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a rat alpha2-Heremans Schmid Glycoprotein (AHSG). The human Ahsg gene is located on chromosome 3q27. AHSG inhibits insulin-induced autophosphorylation of the insulin receptor and insulin receptor tyrosine kinase (IR-TK) activity. Genetic ablation of the Ahsg gene enhances insulin signal transduction and increases whole body insulin sensitivity. The phosphorylation status of AHSG is critical for IR-TK inhibition. The human AHSG protein exists in 2 variant forms. Variant AHSG*1 (ABB70015) has a Met at position 248 and Thr at position 256. Variant AHSG*2 (ABB78015) has a Met at position 248 and Ser at

Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses a composition comprising two or more isolated rat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                composition comprising two or more isolated polypeptides, useful for baring a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
position 256. Inhibition of AHSG activity in a cell augments phosphorylation or tyrosine kinase activity of insulin receptors in liver/muscle cell. AHSG modulators can therefore be used for treating obesity and insulin resistance, increasing insulin sensitivity, preventing/diminishing effect of high-fat diet on body weight gain, or lowering total body fat content

activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic construction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (described in Table 3 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of treating an angiogenesis-mediated disorder in a subject. The method is useful for treating angiogenesis-mediated disorder, e.g., retinal or choroidal neovascularisation or diseases associated with chronic inflammation, myocardial ischaemia, stroke, coronary artery disease or peripheral vascular disease. The present sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of treating an angiogenesis-mediated disorder in a subject. The method is useful for treating angiogenesis-mediated disorder, e.g., retinal or choroidal neovasculariation or diseases associated with chronic inflammation, myocardial ischaemia, stroke, coronary artery disease or peripheral vascular disease. The present sequence is used in the exemplification of the invention.

AMEDISTANDAY, INTRIBUTED THE EXPONENTIFY OF A INDICATE SECULD.

The Secreted proteins and their genes are useful fragments or variants.

C AAEDISTA-AAEDIST represent human secreted protein fragments or variants.

CC AAEDISTA-AAEDIST represent human secreted protein fragments or variants.

CC The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

CC or ameliorating medical conditions, e.g., by protein or gene therapy.

CC new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 32 genes, continued to the tissues in which they are most highly expressed, and include the new genes. Specific uses are described for each of the 32 genes, calevelophing products for the diagnosis or treatment of proliferative disorders, tumours, focatal and developmental abnormalities.

C develophing products for the diagnosis or treatment of proliferative disorders, diseases of the immune system, AIDS, autoimmune continue disorders, atheristis, inflammation, allergies, cognitive disorders, chizophrenia, asthma, skind disorders, conjuditive disorders, taking disorders, datsorders, datsorders, datsorders, datsorders, datsorders, and datsorders, and disorders, and some also be used to aid wound healing and epithalial cell proteins can also be used to aid wound healing and epithalial cell cognary tissues, to regenerate tissues, to identify their cognate ligands or binding commensation, for supporting cell culture of primary tissues, commensation, and can be used additive or binding commensation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic, heparotropic, vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; lammunosuppressant; immunostimulant; cardiant; thrombolytic; casqulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinfilammatory; antibacterial; cartiviral; antitheumatic; antiinfilammatory; antibacterial; equences can be used for determining the presence of or predisposition to, or preventing or treating parhological conditions associated with an cortain in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative used to treat cancers, proliferative disorders, neurodegenerative classed to treat cancers, proliferative disorders, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vulnetary; antipsoriatic; antiparkinsonian; notropic; neuroprotective; anticonvulsant; osteopathic; antiarthritic; immunosuppressant; cardiant; immunosupunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppresssive; antidialaematory; antiviral; antibacterial; antifungal; antirheumatic; antihfyroid; antianaemic; gene therapy; cancer; proliferative disorder; hypotension; neurodegenerative disorder; osteoarthritis; propthyroidism; SciD; AlDS; cardiovascular disease; diabetes mellitus; hypothyroidism; SciD; AlDS; cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; alleryy; aplastic anaemia; nocturnal haemoglobinuia; burn; wound; bone damage; cartilage damage; antiinflammatory disease; coagulation;

This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up conversediated in transgenic plants overexpressing the heterodimeric ETFAJDB transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes generating transgenic plants for the production of growth regulators, enzymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal architecture or physiology, altered endoreduplication, biochemistry, signal architecture configuration, storage lipid mobilisation and/or altered photosynthesis, transduction, storage lipid mobilisation and/or altered photosynthesis and special processes such as DNA replication, cell or issues. The identified genes play a cole in a variety of biological processes such as DNA replication as transcription factors. This polypeptide sequence is thale cress protein expressed by a gene upregulated 1.3 fold or more in plants overexpressing the EZFA/DPa transcription factor, given in an exemplification of the
                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Altering plant characteristics, useful for producing plants for enzyme or pharmaceutical production comprises modifying in a plant, expression of one or more nucleic acids and/or modifying level or activity of one or

AAY13344-403 represent secreted and transmembrane human proteins. The CDNA sequences are obtained from CDNA libraries, prepared from fetal to CDNA sequences are obtained from CDNA libraries, prepared from fetal retina. The canoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated crepair of acute and chronic mucosal lesions (e.g. enterocollits, capair of acute and chronic mucosal lesions (e.g. enterocollits, califorentiation (e.g. peoriasis, epithelial cancers such as lung squamous cell carcinoma of the vulva and gliomas), potent effects on cell growth and development, diseases related to growth or survival of nerve cells and development, diseases, Alzheimer's disease, ALS, neuropathies or cancer. PRO265 can be used as for fibromodulin, e.g. for reducing dermal carring. PRO265 can be used as a target for anti-tumor drugs. PRO269 can be used as a target for anti-tumor drugs. PRO269 can be used as a target for anti-tumor drugs. PRO313 may chave therapeutic applications in wound healing and tissue repair; PRO317 can be used for treating problems of the kidney, uterus, endometrium, con be used for related tissue, e.g. in the heart of genital tract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antiinflamatory; antiulcer; cytostatic; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; vasotropic; chemotaxic; angiogenic;
                                                                                                                                                                                                                                                                                                               New isolated human genes and polypeptides used in, e.g. treatment of gastrointestinal ulceration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 37; DB 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The polypeptides and polynuclectides of the invention may be useful as research tools and as therapeutics for treating enterocalitis, Zollinger-Blison syndrome, gastrointestinal ulceration, psoriasis, cancer, Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarting and wound healing, nerve repair, thrombosis, bone and/or cartilage formation, anglogenesis, asthma, rheumancoid arthritis, multiple sclerosis, inflammatory disorders, atherosclerosis, cardiac injury, infertility, premature aging, ALDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the human PRO protein of the human

The present sequence is one of sixty one novel secreted and transmembrane PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. esthma. Theumatoid arthritis, multiple sclerosis), inflammatory disparentsum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sixty one nucleic acids encoding PRO polypeptides which are useful in the treatment of skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma) and neurodegenerative diseases (e.g. Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
The invention relates to human PRO polypeptides (secreted or transmembrane polypeptides) and the polynucleotides encoding them. The PRO polypeptides and polynucleotides can be used in treating pathological disorders and tumours, in therapeutic treatment of cardiac insufficiency disorders and tumours, in therapeutic treatment of disorders involving pathological cardiacino by the pancreas, including disbetes. They can also be used in treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal celeions, and skin diseases associated with abnormal keratinocyte differentiation (e.g., psoriases, epithelial cancers such as lung squamous cell carcinoma, epidermoid carcinoma of the vulva and gliomas). The sequences can be used as molecular markers for protein

Che squamous can be used as molecular markers for protein

Che squamous can be used as molecular markers and call-based assays.

Che sequence represents a human PRO polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid useful for e.g., treating pathological disorders encodes a secreted or transmembrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ferrara N;

```
The present invention relates to the isolation of novel human secreted and transmembrane proteins (PRO polypeptides), and the polynucleotide sequences are useful in melecular biology, as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide sequences may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or their antibodies are useful in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as cancer. Alzheimer's disease or ischaemia, and in various diagnostic assays. ABU71445-ABU71505 represent human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N; Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; Williams PM, Wood WI;

```

```
The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nucleotide sequence encoding one of a secreted/transmembrane polypeptides, or PRO polypeptides or encoding a CC of secreted/transmembrane polypeptides, or PRO polypeptides or encoding a PRO protein extracellular domain. Also included are a vector comprising the PRO protein extracellular domain. Also included are a vector comprising the PRO polypeptide, and recovering the PRO polypeptide, and recovering the PRO polypeptide (having at least 80% sequence identity to: (a) an amino acid sequence selected from the 61 PRO proteins; (b) an amino acid sequence encoded by a nucleic acid molecule deposited with an ATCC number (detailed in the specification); or (c) an extracellular domain of a PRO polypeptide or to a PRO polypeptide lacking its associated signal competition and sequence, an anti-PRO antibody, detecting a competition and sequence, an anti-PRO antibody, detecting a complaining at least one biological activity of a cell expressing a PRO245 or PRO1868 and modelle to a cell expressing a PRO245 or PRO1868 in a sample suspected of containing the polypeptide or to a PRO biolypeptide or to a cell expressing a PRO245 or PRO1868. Nucleic acids which encode PRO can be used to generate either transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents. The nucleic caids may also be used in gene therapy, in chromosome markers, or in generating probes. The PRO polypeptides are useful may be used for protein electrophoreals, and the isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, in generating probes and in tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ferrara N;

```

nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents a PRO protein

(GETH) GENENTECH INC.

Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N; Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; Williams PM, Wood WI;

WPI; 2003-370793/35. N-PSDB; ACD07602.

New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO335), useful for treating or diagnosing e.g. Alzheimer's disease, cancers, hemorrhage, rheumatoid arthritis, diabetes, cirrhosis, ischemia or strokes.

Claim 12; Fig 86; 482pp; English.

The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American Type Culture Collection (e.g. ATCC Deposit No. 209258), or a sequence with at least 80% identity to a DNA encoding a PRO polypeptide comprising any of 61 sequences having 164-1119 amino acids fully defined in the specification. The PRO polypeptides or polymocleotides are useful as pharmaceuticale, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating e.g. Parkinson's disease, Alzheimer's disease, inflammations, nephritis, wound healing, nerve repair, collateral blood vessel formation, cancers (e.g. colorectal cancer), haemorrhage (or reduce risk for haemorrhage), rheumatoid arbhritis, diabactes, cirrhosis of the liver, fibrosis of the lungs, restenosis, dermal fibrotic conditions (e.g. keloids or scarring),

```
ischaemia, strokes, hypertension, heart attacks, atherosclerosis, or infertility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats, or rabbits) The PRO polypetides are useful as targets for therapeutic intervention in these diseases, and diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA, or mRNA, The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                24-NOV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-SEP-1
                                                                                                                                                                                                                                                          24-OCT-1
                                                                                                                                                                                                                                                                                                                                                                                                                      29-0CT-
The invention relates to an isolated PRO polypeptide having at least 80% amino acid sequence identity to: (a) any one of 61 fully defined amino acid sequence given in the specification (appearing as ABU5437-CC ABU54407); (b) an amino acid sequence encoded by the mucleotide sequence consideration (accession numbers in the specification); (c) any one of the PRO sequences which clack its associated signal peptide; (d) an extracellular domain of the PRO polypeptide which lacks its associated signal peptide; (d) an extracellular domain of the PRO polypeptide which lacks its associated stgnal peptide. Also include are the mucleic acids encoding the PRO polypeptides and nucleic acids are useful in diagnosing or treating optopeptides and nucleic acids are useful; and diseases associated with abnormal keratinocyte differentiation, e.g. psoriasis or epithelial cancers such as sequences cell carcinoma, Albrehmer's disease, Parkinson's cancers such as sequences cell carcinoma, Albrehmer's disease, e.g. rheumatoid arthritis, athma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature adjng, ADDS, cancer, diabetic complications, or mutations in general. The prolypeptides are also useful for wound repair and associated therapies concerned with re-growth of tissue. The nucleotide sequences may be used antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules are also useful in the development and screening of therapeutically useful reagents, for chromosome addentification, and therapeutically useful reagents, for chromosome addentification of the present sequence assays for PRO, or chromosome addentification of encourate transgenic animals or therapeutically useful reagents, for chromosome addentification of electrophoresis purposes; The anti-PRO antibodies may be used in ceromainer cell culture or natural sources. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, abnormal bleeding; gynaecological disease, asthma, hysterectomy; anglogenesis; coronary ischaemic condition; skin disease; gastrointestinal mucosa disorder; acute mucosal lesion; neuropathy; ALS; chronic mucosal lesion; banormal keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's disease, amyotrophic lateral sclerosis; uncontrolled cell growth, cancer; blood cosquiation cascade; thrombosis; haemorrhage; endometrial bleeding; anglogenesis; wound healing; tumour; tissue repair; rheumatoid arthritis; multiple sclerosis; tissue typing.

The invention relates to an isolated PRO polypeptide. PRO317 is useful in diagnosing or treating abnormal bleeding involved in gynecological diseases e.g. to avoid or lessen the need for hysterectomy. PRO317 may also be useful as an agent that affects angiogenesis and PRO317 is useful in anti-tumour indications or in treating coronary ischaemic conditions. PRO211 and PRO317 polypeptides are useful for treating disorders cassociated with the preservation and maintenance of gastrointestinal macona the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis). PRO3187 polypeptide is useful for treating Parkinson's disease. PRO219 of places, amyotrophic lateral sclerosis (ALS), neuropathies of add disease, amyotrophic lateral sclerosis (ALS), neuropathies compasses, amyotrophic lateral sclerosis (ALS), neuropathies compassed which serves as tumour specific antigens may be cyplypeptide plays a regulatory role in the blood coagulation cascade. PRO346 polypeptide swhich serves as tumour specific antigens may be cyplypeptide is useful as an antithrombotic agent with reduced risk for haemorrhage as compared with hepatin. PRO317 polypeptide is useful in the retain manual prosection have therapeutic applications in wound healing and tissue regular correction have therapeutic applications in wound healing and multiple sclerosis. The polypeptide and untiple sclerosis. The polypeptide and its nucleic acid are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, issues or serum and for a returning corrected, transmembrane PRO polypeptide

The invention discloses isolated PRO secreted/transmembrane polypeptides
and the nucleic acid encoding them. The polypeptides can be used to raise
antibodies that specifically bind to the PRO polypeptide, for linking a
bloactive molecule to a cell expressing a PRO portocin and for linking a
t least one biological activity of a cell. The PRO polypeptides or
c polynucleotides are also useful as pharmaceuticals, diagnostics,
c blosensors or bioreactors, for detecting or treating e.g. hyperplasia,
coronary arterial disease, polycystic kidney disease, chronic or acute
renal failure, or inflammatory responses (e.g. asthma, rheumatoid
arthritis, psoriasis or multiple sclerosis) in mammals. The PRO genes may
also be used in gene therapy, particularly for replacing a defective
gene. The sequences presented in ABU64499-ABU64559 are the PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New secreted and transmembrane PRO polypeptides (e.g. PRO533 or PRO245) and genes encoding them, useful for detecting or treating e.g. hyperplasia, endometriosis, cancers, ischemia, coronary arterial disease or inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Desnoyers L, Eaton DL,

transgenic animals or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptide or the antibody is used in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as mucosal lesions e.g. ulears and enterocolitis, skin disease e.g. psoriasis, cancer e.g. lung cancer and colon cancer, nerve cell disease e.g. Alzheimer's disease and Parkinson's disease usher syndrome, atrophia areata, angiogenesis, inflammatory disease e.g asthma and rheumatoid arthritis, ischaemia, and in various diagnostic assays. The present sequence represents the amino acid sequence of a PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                         Human, gene therapy, tumour, tissue typing, obesity, arthritis, diabetes, hypoinsulinaemia, hyperinsulinaemia, vascular permeability, cardiac insufficiency disorder, immune response, regeneration, cartilage, auditory hair cell, hearing loss, bone disorder; sports injury.

                                                                                                                                                                                                                                                                                                                                   The invention relates to sixty one nucleic acids encoding PRO polyPeptides (secreted and transmembrane). The polynucleotide is useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sixty one isolated nucleic acids encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in chromosome and gene mapping, in generating antisense RNA and DNA, and in treating cancer and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  , Botstein D, Desnoyers L, Eaton DL, Ferrara N; Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Paoni NF, Roy MA, Stewart TA, Tumas D; Wood WI;

```
The invention relates to an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide. The polypeptide is useful for identifying agonists of the polypeptide, for preparing variants of the polypeptide, as molecular weight markers for protein electrophoreasis purpose and the nucleic acid is useful for recombinantly expressing those markers. The polypeptide is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. The nucleic acid is useful as molecules involved in binding interaction. The nucleic acid is useful as therapeutic actives in the preparation of PRO polypeptide, for antisense RNA and DNA, in the preparation of PRO polypeptide, for antisense RNA and DNA, in the preparation of PRO polypeptide, for antisense the PRO and for the genetic analysis of individuals which is reagents, to construct hybridisation probes for mapping the gene which reagents, to make therapy, for chromosome identification, as chromosome marker, and for generating probes for polymerase chain reaction (PCR), Northern analysis, Southern analysis and Western analysis. PRO antibody is useful for the preparation of medicament for treating to superition of propertide or its antibody e.g. tumour. The polypeptide and the nucleic acid is useful for the preparation of medicament for treating obesity, diabetes or subjective is useful for treating bear typing. The polypeptide is useful for treating bear typing reperted the minner and experience is an uninverse or hypo- or hypo- or hypo- or hypo- or hypo- or described by the en
                               Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; p53 pathway; Leucine rich repeat capricious related protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -0CT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2-NOV-
              The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity, where a difference between the agent based activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

```

The invention describes sixty one nucleic acids encoding PRO polypeptides (secreted and transmembrane). The PRO polypeptides and nucleic acids are useful in diagnosing or treating entercolitis, gastrointestinal ulceration, skin diseases associated with abnormal keratinocyte differentiation, e.g. psoriasis or epithelial cancers such as squamous cell carcinoma, Alzhaimer's disease, Parkinson's disease, amyortrophic lateral sclerosis, inflammatory diseases, e.g. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications, or mutations in general The polypeptides are also useful for wound repair and associated therapies concerned with regrowth of tissue. The PRO polypeptides and nucleic acid molecules are

also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This is the amino acid sequence of a novel human PRO polypeptide

The invention relates to an isolated secreted and transmembrane PRO polypeptides are useful for modulating biological completed of the properties are useful for modulating biological completed diseases e.g. to avoid or lessen the need for in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy, for treating angiogenesis, tumour, coronary ischaemic condition, disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal esions, skin diseases associated with abnormal keratinocyte disease, amyortophic lateral solerosis (ALS), neuropathies, disease colfiferentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's disease, amyortophic lateral solerosis (ALS), neuropathies, disease colfiferential bleeding, wound healing, tissue repair, asthma, rheumatoid carching wound healing, tissue repair, asthma, rheumatoid arthritis, multiple sclerosis Nucleic acid encoding PRO polypeptides are useful in molecular biology including uses as hybridisation probes and in the generation of antisense RNA and DNA, for preparing PRO polypeptides, cor generation of antisense RNA and DNA, for preparing PRO polypeptides, cor generating transgenic animals or knockout animals. The PRO corpieds are useful for immunohistochemical staining and/or assay of antibodies are useful for immunohistochemical staining and/or assay of antibodies are useful for immunohistochemical staining and corpused for affinity purification of PRO form recombinant cell culture or natural constructs. The present sequence represents the amino acid sequence of a human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; PRO; secreted; transmembrane; gastrointestinal mucosa, mucosal lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's diseases amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue; apoptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticosgulant.

WPI; 2003-765473/72. N-PSDB; ADB29449 Novel isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, Usher syndrome.

Claim 12; Fig 86; 469pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloative molecule to a cell expressing a PRO polypeptides are useful can the aniocule to a cell expressing a PRO polypeptides are useful conformation other PRO polypeptides in a sample and for linking a bloadtive molecule to a cell expressing a PRO polypeptides are useful conformation other PRO polypeptides in a sample and for linking a bloadtive molecule to a cell expressing a PRO polypeptides are useful conformation of a cell expressing PRO polypeptides are also useful conformation of activity of a cell expressing a PRO polypeptides are also useful conformation (c.g. psoriata) bloadied with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal conformation (c.g. psoriata) Parkinson's disease, languages associated with abnormal keratinosotte conformation (c.g. psoriata) parkinson's disease, languages and the relation (c.g. psoriata) parkinson's disease, languages and the relation (c.g. psoriata) parkinson's disease, languages and the relation (c.g. psoriata) in vivo for lessening the effects of viral infection. The PRO polypeptides as tumour specific antiogen which may be exploited as a role in meurodegenerative diseases or their reversal, as an attituromboric agant with reduced risk for haemorrhage as compared with heaperin, in readued risk for haemorrhage as compared and are also encomertial bleeding and openeral and may also have an effect on kidney to cisolate the full-length PRO compared disorders, in modulating of some which have a role in apoptosis. The polymelotedises are useful in molecular bid witch are useful, in the generating reference of the rapeutically useful reagents, as probes and for the genetic animals which are useful an electropheresis are preparable and gene mapping, in the denerating conference of individuals with parel de

    ô
diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PRO polynucleotide of the invention.

```
The invention relates to a method of killing a cancer cell, which expresses a tumour-associated antigenic target (TAT) polypeptide, which comprises contacting the cancer cell with an antibody, oligopeptide or organic molecule that binds to the TAT polypeptide on the cancer cell, thus killing the cancer cell. The method is useful for killing cancer cells, particularly breast, ovarian or uterine cancer cells. The method is particularly useful for inhibiting the growth of, treating or preventing tumours or cancers in mammals. This method is also useful for diagnosing the presence of tumours. The anti-TAT antibodise may also be used in Antibody Dependent Ensyme Mediated Produg Therapy (ADEPT) by conjugating the antibody to a prodrug-activating enzyme, which converts a prodrug (e.g. a peptidyl chemocherapeutic agent) to an active anti-cancer associated antigenic target, TAT292
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Killing cancer cells (e.g. breast cancer cells), particularly for treating or preventing tumors in mammals, by contacting the cancer cells with an inhibitor (e.g. antibody) of a tumor-associated antigenic target (TAT) polypeptide.

antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating a tell enate one biological activity of a cell PRO polypeptides are useful to detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptides are also useful to propeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides are also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of a cell expressing PRO polypeptides are lated to uncontrolled cell growth, e.g. cancer. CC differentiation (e.g. psorissis), parkinson's disease, Altheimer's additionally, disease related to uncontrolled cell growth, e.g. cancer. CC differentiation (e.g. psorissis), parkinson's disease, amyotrophic lateral selected with abnormal keratinocyce diseases, amyotrophic lateral selected in monontrolled cell growth, e.g. cancer. CC properties as therapeutic targets for anti-tumour drugs, and are also additionally, disease related to uncontrolled cell growth, e.g. cancer. CC properties as therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine the transputically in vivo for lessening the effects of viral infection. The PRO polypeptides and their portions affect the expression of entithromobetic agent with reduced risk for heamorthage as compared with heparin, in treating other PRO-associated disorders, in modulating of control of properties are note in apoptosis. The polymcloctides are useful in molecular biology including uses as hybridisation probes for control of properties and their portions and for the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals which are useful in the generation of antisense RNA and properties the PRO polypeptides, for generating cransgenic animals and/or assay for PRO ex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 713 AA;

New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO1868), useful for treating or diagnosing e.g. cancers, atherosclerosis, infertility, stroke, AIDS or multiple sclerosis in

ME, Goddard A; Kljavin IJ; Tumas D; Ferrara N;

Claim 12; Fig 86; 476pp; English.

The invention relates to an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 61 PRO (secreted and transmembrane protein) polypeptides appearing as AB032756-AB032816; or (b) any of 61 nucleotide sequences having 50-4053bp (c) these 61 nucleotide sequences. Also included are the isolated PRO oplypeptide (lacting its associated signal peptide or an extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide or an extracellular comprising the vector comprising the nucleotide sequence, an anti-PRO antibody, detecting PRO345 or PRO1868 or comprising the vector (nact to propertide), a chimaeric comprising the vector anti-PRO antibody, detecting PRO345 or PRO1868 polypeptide and anti-PRO antibody, detecting PRO345 or PRO1868 polypeptide and modulating at least one biological activity of corporations, linking a bioactive molecule to a cell expressing a PRO245 or PRO1868 polypeptide and modulating at least one biological activity of a cell expressing the PRO245 or PRO1868 polypeptide and modulating at least one biological activity of a cell expressing the PRO245 or PRO1868 polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or ploractors. These are useful as particularly useful for diagnostics, multiple sclerosis, infertility, birth defects, premature aging, malignancy e.g. inflammations, rheumatoid arthritis, psoriasis, multiple sclerosis, atherosclerosis, infertility, birth defects, premature aging, malignancy or e.g. cancers), strokes, heart attacks, hypertension, gastrointeetinal ulcerations, Parkinson's diseases, Alzheimer's disease, or AIDS in unammals. These are also useful for modulating cholesterol uptake in the useful in drug screening, the PRO pense park. The PRO pense are useful as phytidisation probes, or for screening probes, or for screening linking energy, particularly for replacing a defective gequence represents a PRO polypeptide are alse useful and p

Novel secreted and transmembrane PRO polypeptides and polynucleotides encoding them, useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.

Claim 12, Fig 86; 475pp; English

```
transmenbrane polypeptides) and the PRO polymucleotides encoding them. The PRO polypeptides and polymucleotides can be used in diagnosing or treating abnormal bleeding involved in gynacological diseases e.g. to avoid or lessen the need for hysterectomy. They can also be used in preservation and maintenance of gastroincestinal mucosa and the repair of keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, asthma 'rheumatoid arthritis, multiple sclerosis, almostrophic lateral sclerosis (ALS), neuropathies and diseases related to uncontrolled cell growth, such as cancer. Sequences ABO34816-ABO34876 represent human PRO polypeptides of the invention

Botstein D, Desnoyers L, Eaton DL, Ferrara N; Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; an J, Paoni NF, Roy MA, Stewart TA, Tumas D; Pan J, Pac, Wood WI; (GETH) GENENTECH INC Ashkenazi A, Filvaroff E, Godowski PJ, Williams PM, Mather JP,

WPI; 2003-521801/49. N-PSDB; ADA16280. New genes encoding for secreted and transmembrane PRO polypeptides, useful for treating e.g. cardiac insufficiency disorders, wounds, cancers, obesity, diabetes, hyperinsulinemia, hypoinsulinemia, or arthritis.

Claim 12; SEQ ID NO 245; 476pp; English.

the invention disciplate isolated to the polypoptides can be used to raise and the muclaic acid encoding them. The polypoptides can be used to raise and the muclaic acid encoding them. The polypoptides can be useful as phenomena to the polypoptides are useful as parell for moulating for linking a bloactive molecule to a cell expressing a PRO polypoptides. The PRO polypoptides are useful as pharmaceuticals, diagnostics, blosensors of a cell expressing a PRO polypoptides or the proliferation of the proliferation and/or cells, modulating proliferation and/or cells, modulating or treating or treating cardiac insufficiency disorders, wounds, cancerous cretinitis pigmentosum, obesity, diabetes, hyperinaulinemia, or bone or cartilage disorders (e.g. sports sinjuries or retinitis pigmentosum), obesity, diabetes, hyperinaulinemia, or bone or cartilage disorders (e.g. sports sinjuries or crimitis pigmentosum), obesity, diabetes, hyperinaulinemia, or bone or cartilage disorders (e.g. sports sinjuries or crimitis pigmentosum), obesity, diabetes, hyperinaulinemia, or bone or cartilage disorders (e.g. sports sinjuries or combinantly propressing the process and their portions affect the crimitis pigmentosum, obelity and polypoptides or the development and gene mapping, in the generating transgenic conformation of the propersing the process, as therapoutic The invention discloses isolated PRO secreted/transmembrane polypeptides nvention.
